Q1: i) It is regular language as it's finite machine is possible as it is $i \geq 0$ so Klean closure can work.

ii) It is regular language as we can have its finite solution

iii) It is not a regular language as we need memory to store value of n to make it large the no.

iv) It is not a regular language as we need memory to store value of n to make it larger than n

v) It is regular language as it is Klean closure.

vi) It is not a regular language as we need different FA's for it.

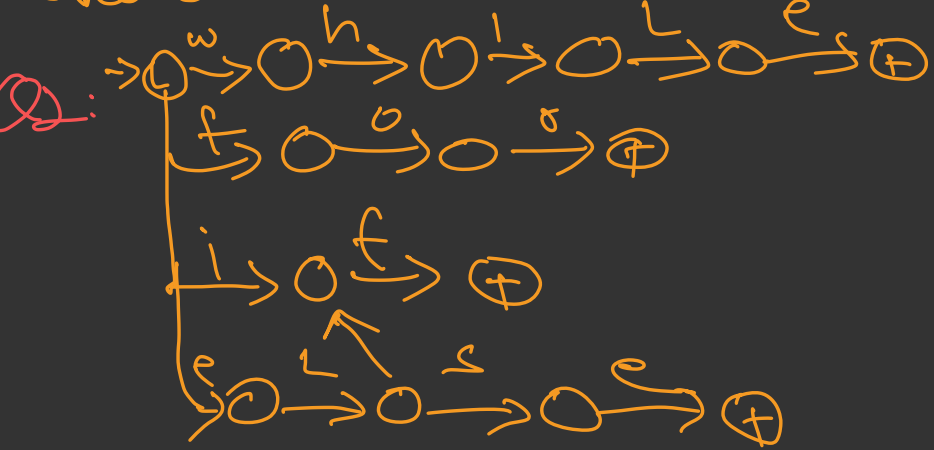
vii) It is regular language as we can make DFA of it

viii) It is not a regular language as "a" power

fixedare need different DFA' for it

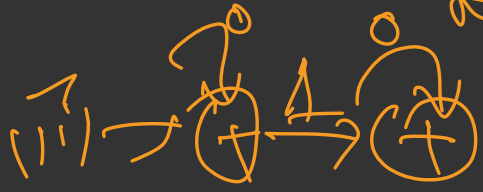
x) It is not a regular language as we need stack to store value.

xi) It is not a regular language we need stack to keep track of number of "b" and "a".

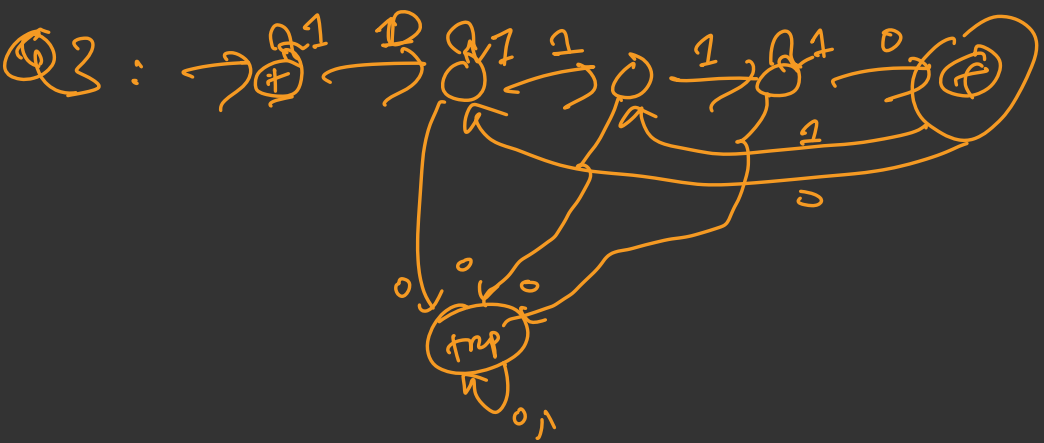


iii)

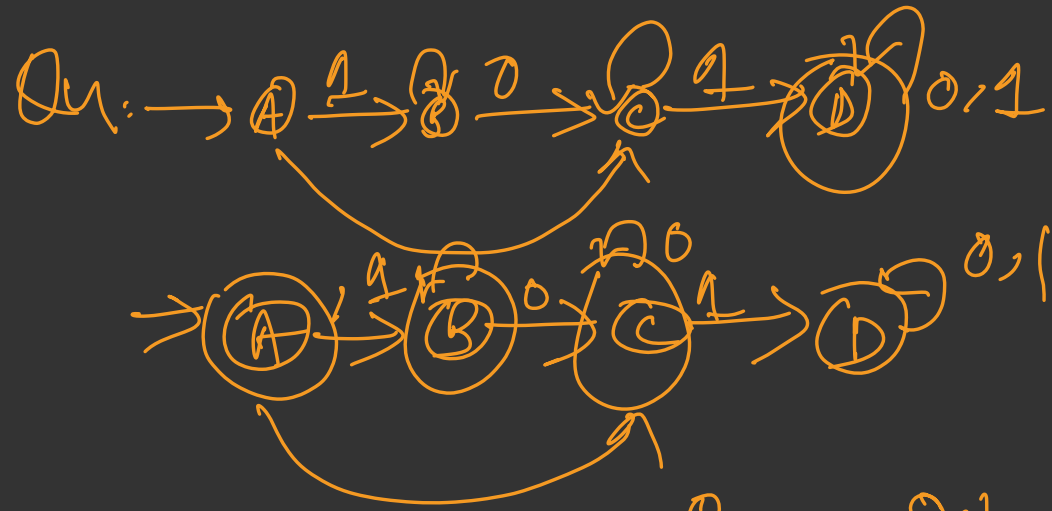
iii)



Q3 :



Q4 :



ii)

iii) Regular Exp of Q2 : $(11+0+0)(0+1)^*$

Regular Exp of Q2 = $1^*00^*(0+1)$

They both are same as they validate same strings.

DFA2 is more like minimized of DFA1

Example $\{101, 01, 0100101\}$

Hence DFA1 = DFA2
